Aberdeen

Preface

Acknowledgements

Aberdeen is at a crossroads. For decades following the discovery of North Sea oil, Aberdeen bucked the trend set by other Northern and Scottish cities of falling into economic malaise following the phasing out of their secondary sectors. Oil is a finite resource and the economic buoyancy provided by the oil fields in the North Sea lie at a third of their peak in the 90s. How can Aberdeen transition out of oil reliance in the next 50 years and how can the built fabric of the city support its inhabitants in this period of transition?

This masterplan is the result of a collaborative effort, and we extend our deepest gratitude to all who contributed to its development. The final product has been made possible owing to the knowledge and insight from the following:

Travel from Aberdeen

Study Trip

Day 0

Arrival

We arrived in Aberdeen on a stormy Saturday afternoon. After taking the bus into the city centre, we finally had our first glimpse of the 'Granite City.'

We passed several large-scale murals and walked by the Terrace Gardens, a recent public-realm development along Union Street. The Union street was wide and unusually quiet, giving the city a ghost-town atmosphere. The only nightlife we encountered was in the industrial area near Footdee, the historic fishing village where we stayed,

where a warehouse has been repurposed as a music venue

Day 1

Old Aberdeen

Old Aberdeen lies north of the city, where the University of Aberdeen is located. The streets there are much narrower and paved with stone.

We first visited the park near the Donmouth Nature Reserve, a hilly landscape with abundant wildlife.

Afterward, we walked around the campus and visited the library. The top floor offers a panoramic view of the coastline, which is largely occupied by golf courses. Most buildings are low-rise, providing an uninterrupted

view across Aberdeen.

We returned home in the late afternoon and explored our neighbourhood, the historic village of Footdee. The beachfront quickly became one of our favourite spots in Aberdeen.

Day 2

West End/ Tillydrone/ Kittybrewster

We walked west to explore the residential area, which is dominated by granite houses due to its proximity to Rubislaw Quarry. The quarry is now closed and fenced off.

We then split into two groups and headed separately to Tillydrone and Kittybrewster, adjacent neighbourhoods near the University of Aberdeen and the River Don. The state housing in Tillydrone, built in the 1960s, is influenced by Scandinavian architecture. Kittybrewster is home to the

Maggie's Centre and is the site of the freight siding terminal.

Day 3

Civic Core and Robert Gordon University

On Day 3, we met David McLean, the former Head of Department at Robert Gordon University. He guided us on a short tour of central Aberdeen, providing commentary on the urban issues we had previously observed and introducing new perspectives. Together, we walked along the River Dee towards the Robert Gordon University campus, where we met Neil [surname], who gave us a brief overview of Aberdeen's historical development. Later, in discussion with David, we explored the emerging

opportunities for the city's regeneration and reflected on whether, as an Aberdonian, he remains optimistic about Aberdeen's future prospects.

Day 4

Cultural Institutions and Torry

On Day 4, we visited the Aberdeen Maritime Museum, which focuses on the city's key maritime industries—fishing, shipbuilding, trade, and oil production—building on the historical context introduced earlier by Neil [surname]. We then explored the Aberdeen Art Gallery, where the recent renovation successfully added new exhibition spaces and a rooftop terrace, showcasing both historic and contemporary works by Aberdonian and international artists. To conclude the day, we visited Torry,

observing its distinctive coastal landscape, residential character, and the contrasting atmosphere it presents compared to the rest of the city.

Day 5

Travel from Aberdeen

On our final day in Aberdeen, we walked along the coastline and through nearby residential areas, passing by the ballroom and witnessing the demolition of a site, which later is going to be turned into a skate park, eventually reaching the city centre. We visited Aberdeen train station, which appeared unusually quiet, and passed through the Union Square shopping mall, notable for its unexpectedly large scale within such a central location. Later in the day, we returned to our cottage in Footdee, spending

some time exploring the area before packing up for departure. We observed that the city's underdeveloped transport links made the journey to the airport unnecessarily long, prompting us to take a taxi instead—an issue we later identified as a key area for improvement in our project.

— Car/Taxi
— Walk

Carbon Footprint

Calculations

Due to the underdeveloped and overpriced public transport in Aberdeen, we relied on taxis more than anticipated. The nearest bus stop was about a 20-minute walk from our accommodation, making the area fairly inaccessible. Through our proposed development, we aim to strengthen public transport links and improve access for cyclists and pedestrians, reducing dependence on private vehicles. We also noticed the lack of a direct connection between Aberdeen Airport and the city's

central train station, which further encourages taxi use. Our group's trip generated around 2.1 tonnes of CO₂, with 95% coming from the flights between London and Aberdeen. This highlighted the significant environmental impact of flying and reinforced the importance of promoting more sustainable travel options.

Key Issues

Observations

From our interviews and early research, my team and I identified four main issues shaping Aberdeen today: the energy transition, ongoing repopulation pressures, a significant cultural deficit, and increasing flooding risks. These challenges collectively outline the critical context for our project.

Energy Transition

The Shift

Aberdeen must shift from oil-dependent infrastructure to a renewable, diversified energy economy. The transition demands new spatial, social and industrial models that integrate clean energy production visibly into the city's identity.

Skills Transition

Urban Repopulation

Means

Decades of decline in city-centre living have left Aberdeen with vacant land, low footfall and weak urban vitality. Reintroducing density, mixed housing and active public space is essential to rebuild a vibrant, lived-in core.

Regional Strategies

Sustainability

Energy

The site operates on a low-temperature ambient loop ($\approx 10\text{--}25\text{ }^{\circ}\text{C}$) that circulates warm water between buildings. Small heat pumps provide heating and reuse waste or harbour heat, while an energy hub links to the city network. This system can cut heating energy costs by about 22 % compared to a high-temperature loop.

Sustainability

Adaptive Design

Since early design stage, we have come up with a few strategies - using local materials, retrofitting old granite building, climate resilient design decisions, repurposing existing warehouses and structures to comply our reducing energy and carbon narrative.

Use local materials

Resilient Building Design

Add Cladding

Add Murals

Reusing oil tanks at landscape

Reusing oil rig steel structure as bridge structure

Retrofit existing warehouse and repurpose abandoned oil equipment

Existing Transport Network

Our analysis showed that Aberdeen's current network relies heavily on cars, with weak cross-city links and frequent congestion. There is also no direct rail connection to the airport

Proposed Transport Network

In our proposal, a new coastal tram line creates a clear, sustainable movement spine through key neighbourhoods, while a new rail link to the airport strengthens regional connectivity. Together, these interventions ease traffic, improve legibility, and support more active nodes across the city.

Contain Urban Sprawl

Golf Course

Diversifying & Softening the Edge

Aberdeen struggles with urban sprawl, so we reinforce the green belt to contain expansion and strengthen the city's landscape structure. At the golf course, we soften and diversify the edge, turning a hard boundary into accessible public green space that supports ecology, improves wayfinding, and enhances first impressions of the city.

Flooding

Wetlands

Before

After

Tunnel

Before

After

Sponge streets

Sand Dunes and Breakwater

Aberdeen is increasingly affected by river flooding, with vulnerable areas extending far upstream along the Dee and Don. To address this, we propose a series of landscape-based interventions that slow, store, and redirect water more sustainably. Wetlands are redesigned into multi-layered ecological parks that hold floodwater while creating new habitats. Cloudburst tunnels provide underground storage and double as cycle routes, and sponge streets manage surface water at neighbourhood scale.

Interventions

City Strategies

- Locate
- River
- Union Street/Retail city centre
- oil
- golf course
- nature reserve
- transport
- offshore wind
- education

This map highlights the key factors that led us to select the harbour as our site. Positioned between the rivers Dee and Don, it acts as a natural urban and ecological hinge. The area is central to Aberdeen's energy transition, with major oil-related functions shifting toward new uses. Along the coast, the site sits within a gap in the continuous green edge, making it a logical place to restore and strengthen this landscape connection. Its proximity to Union Street and its equal distance from both universities reinforces the site as a strategic location linking the city's main educational, cultural, and economic assets.

City Interventions

Precedents for our City Centre strategy have been collated with 'activation' in mind, taking to the what was described to us as a 'friendly ghost town' and increasing the chance of social interaction and footfall. This would include unclogging historic high streets of large retail centres, squares of cars, and the railway gateway into Aberdeen of its view straight into a semi derelict car park.

Green Corridor
Promenade
Vista
Flooding Interventions
Building Repurpose
Connectivity
Energy

Locale Strategies

Green Corridor

Beachfront

Our site breaks Aberdeen's continuous green coastline, so we restore this connection by extending the native sand dune landscape. Inspired by the Nice Beachfront, we introduce a clear separation of movement: a seafront walkway

and cycle route positioned away from the transport-heavy road and sauna pods. These moves reconnect the coastline, improve resilience, and create a safer, more enjoyable waterfront experience.

Promenade

Waterfront engagement

A key ambition of our masterplan is to activate Aberdeen's waterfront, providing public access and engagement the city has historically lacked. Inspired by Bjørvika in Oslo, our promenade deck creates a generous, accessible edge using

reused materials. Opposite this, projecting platforms inspired by Dania Park, Malmö extend into the harbour, softening the water's dominance and forming intimate places for gathering, resting, and enjoying the waterfront.

Vistas

Key Views

We draw from this approach by establishing primary and secondary view corridors across our locale, using vistas to organise circulation, highlight key landmarks, and strengthen legibility along the waterfront and coastal edge.

Biodiversity

Floating meadows

Floating wetlands, or water meadows, offer a simple way to clean urban waterways by filtering pollutants and creating habitat. In Aberdeen Harbour, long shaped by industrial use, they help improve water quality and soften the hard coastal edge.

Introducing these wetlands creates a nature-based system that boosts biodiversity and restores ecological functions, transforming the harbour into a healthier and more resilient public waterfront.

Main Flood Zones

1 NORRØN - THE BLUE PLATEAU

2 DUISBURG NORD LANDSCAPE PARK BY PETER LATZ

3 THAMES BARRIER

4 LEÇA SWIMMING POOLS

Aberdeen is increasingly affected by coastal flooding, with the Footdee area and the north finger of our site being particularly vulnerable. Our first response was to strengthen coastal protection through sand dunes, breakwaters, and an extended sea wall. However, the north finger presented a more complex challenge. We initially considered transforming it into a fully floodable green space, a “water plaza.” Yet, given its strategic location and high development value, we explored a more balanced solution. We now propose a barrage system, inspired by the Thames Barrier. It would remain open under normal conditions, preserving tidal flow, but would close during extreme events, projected to occur roughly once in 200 years by 2080 to prevent flooding and protect the site.

Floodable Design

Amphitheatre & Raised Boardwalk

We aim to integrate an amphitheatre as a key gathering space. This space can host exhibitions, competitions, public meetings, and performances—becoming a civic amenity that symbolises land returned to the public after the relocation

of the oil industry. It could also function as a floodable event space, with potential use during the Tall Ships Race. By stepping down toward the water, the amphitheatre strengthens connectivity to the harbour and allows for playful activities.

Footdee

Sand Dune & Live Breakwater

Footdee is most at risk from flooding being between the mouth of the River Dee and the port, yet a Conservation Area and Grade II listed. Our scenarios include: Relocation (e.g. Weald & Downland Living Museum), Hard flood defence (long wall),

Full Flooding (plan for safe full flood of Footdee, evacuation of residents), Soft flood defence (layered strategies including sand dunes, breakwater, retractable flood wall).

Full Flooding

Hard flood defence

Relocation

Soft flood defence

Buildings Analysis

Age, Function, Height

We analysed all buildings in our locale by age, function, and height to understand what should be kept, adapted, or replaced. Older, characterful buildings were retained and integrated into the masterplan, while newer industrial sheds were assessed for reuse potential. Those suitable for adaptation were repurposed; others were dismantled so their materials could be reused. This approach preserves local

heritage while supporting a circular, resource-efficient redevelopment.

Building Age

1837-1869	1980-1989
1870-1918	1990-1999
1919-1944	Complex Age

Repurpose Buildings Strategy

- Conservation area
- Demolish
- Keep
- Footprint/Volume

4 Typologies

Precedents

These precedents illustrate how industrial or historic structures can inform new interventions through four key strategies:

1. **Demolish:**
Ground Zero turns the towers' voids into a memorial landscape.
2. **Volume:**
Krøyers Plads reinterprets the scale of former warehouses.
3. **Footprint:**
London's Gasholders reuse the historic iron frame as housing.
4. **Retain:**
Sydney's Carriageworks preserves and adapts the original steel shed.

Regent Bridge

Relics of the past

The old Regent Bridge was constructed in 2-Halves from cast-iron girders, designed by Thomas Telford and built by Harper & Co in 1810. It served traffic and the original bridge swung to allow ships through. The expansion of trade at Aberdeen Harbour, introduction of steamships made the bridge a relic of the past, no longer useful.

As an ode to the age of the 'Venerable', we would like to propose to use the same bridge design in our proposal, as seen in the render on the bottom left, and the sketch to the right. Other bridges on the site will follow a similar language, but with warm tones and modern design such as Tintra Footbridge by Rintala Eggertsson Architects.

Cordona's

Relocating and reviving a childhood memory

Speaking to a local, Cordona's amusement park resides in a whole generation of Aberdonians. Currently in an outdated retail park by the beach, and unloved. We would like to propose its relocation to the heart of the city by the port. This would allow landscape opportunities by the beach and a playful brief by the port providing F&B and entertainment attraction by the pier. The revival of the ferris wheel would also provide a view of the city centre and the north sea.

Multi-Centered Locale

Instead of creating a single focal point, our masterplan establishes a network of smaller centres, each offering different programs and experiences. By dispersing activities across the site, we ensure that every area remains active, engaging, and meaningful for both visitors and residents. This multi-centered approach creates a richer urban experience and supports a more vibrant, resilient waterfront community.

Our connectivity strategy creates a multimodal network that strengthens links across the harbour and into the wider city. Initially we proposed a tram line running along the coast, but after reviewing feasibility and cost, this was redesigned as a guided bus route. This still delivers a fast, reliable public-transport spine and now includes an additional stop near Footdee, improving accessibility for local residents.

Continuous cycle routes connect the site with Torry, offering both a quick route across the bridges and a slower, scenic route along the promenade for walking and leisure. The proposed ferry terminal acts as a major arrival point for people entering Aberdeen by sea, integrating directly with bike paths and the guided bus stops to provide onward movement into the city.

- Bike parking and rent
- Tram stops
- Ferry terminal
- Pedestrian access
- ↔ Cycle route
- ⋯→ Tram line
- ⋯→ Ferry line

Connectivity

Interim Crit
Final Crit
Design Development

Feedback and Reflections

Interim Review

- Strong narrative: old harbour to energy-transition hub fits the site.
- Waterfront fingers suit a car-free, child-friendly community with great views.
- Phase 3 waterfront (housing + realm) can be a solid proof-of-concept
- Precedents like Borneo and Sporenburg, Malmö, Fittie innovation hubs fit the site's grain.
- Key site logic unclear: need for clearer diagrams
- Harbour 'fingers' need work: higher density, better sections, remove unnecessary big public space.
- Transport unresolved: end access, nodes and innovation cluster grain need clarity

Site Model

1:2500

Testing building scale and colour

Gray 3D printed for the quantity and colour quality.

Testing model scale

1:2500 would mean two A0s.

Building colour/ terrain colour

Spray painted textured tone for terrain for visual differentiation.

Laser cutting

Cutting contours in foam as a base layer spray painted card as a top layer.

Our model sought to replicate our impressions of Aberdeen, true to the city's grey buildings and warm toned nature. Framed in a dark brown frame as a maritime reference. This model would be used for displaying our ideas for massing, view points, of our masterplan and in the future the individual projects which will showcase our cultural and activating proposals.

s a foundation layer, top
nd laser cut.

Cutting and painting contours

Cutting contours in foam as a foundation layer,
painting it dark brown to match the laser cut edges.

Water Part I

Firstly water was made of wax, this cracked because
of the model's scale, making the model unmovable.

Water Part II

Removed all wax, water texture created by hand
and shine created with water-based laquer.

Final Review

- Ambitious, varied waterfront vision.
- Strong focus on the harbour as the project's anchor.
- Interesting mix of residential and mixed-use typologies.
- Fantastic opportunity for Aberdeen.
- The Dutch-style frontage doesn't extend fully to the water, and it's unclear why the buildings are set back.
- Cultural buildings at the finger tips risk creating exposed, hostile public spaces.
- Scale issues: dwelling sizes, proportions, and building heights felt inconsistent.
- Central mixed-use area and northern edge weren't convincing or attractive enough.

Key Moves

The diagrams illustrate the key moves for each phase of a business plan, organized into three main categories: GOALS, STRATEGIES, and TACTICS.

- Phase 1: Business Plan Development**
 - GOALS**
 - Develop a comprehensive business plan
 - Identify key stakeholders
 - STRATEGIES**
 - Define the business vision and mission
 - Identify the target market
 - Develop a competitive advantage
 - TACTICS**
 - Develop a marketing strategy
 - Develop a financial strategy
 - Develop a human resources strategy
- Phase 2: Market Research**
 - GOALS**
 - Identify the target market
 - Understand the market environment
 - STRATEGIES**
 - Develop a market research strategy
 - Identify key market segments
 - TACTICS**
 - Develop a market research plan
 - Identify key market segments
- Phase 3: Financial Projections**
 - GOALS**
 - Develop a financial plan
 - Identify key financial metrics
 - STRATEGIES**
 - Develop a financial strategy
 - Identify key financial metrics
 - TACTICS**
 - Develop a financial plan
 - Identify key financial metrics
- Phase 4: Marketing Strategy**
 - GOALS**
 - Develop a marketing strategy
 - Identify key marketing metrics
 - STRATEGIES**
 - Develop a marketing strategy
 - Identify key marketing metrics
 - TACTICS**
 - Develop a marketing plan
 - Identify key marketing metrics
- Phase 5: Implementation and Monitoring**
 - GOALS**
 - Implement the business plan
 - Monitor key performance indicators
 - STRATEGIES**
 - Develop a monitoring strategy
 - Identify key performance indicators
 - TACTICS**
 - Develop a monitoring plan
 - Identify key performance indicators

[illegible]

Design Guide

Commercial Campus buildings are designed to achieve LEED Gold or Silver certification. They all have more than 100,000 sq ft of space and are designed to accommodate a wide range of uses.

- Design efficient systems to reduce energy use, including energy storage, air conditioning, lighting and other systems.
- Performance design is essential in building energy-efficient, green buildings for a long building life.

Site Plan
The site plan shows the building's location on the site, including the parking lot, landscaping, and other features.

Section View
The section view shows the building's internal structure, including the floors, walls, and roof.

Interior View
The interior view shows the building's interior space, including the floors, walls, and ceiling.

Exterior View
The exterior view shows the building's exterior facade, including the windows, doors, and landscaping.

[illegible]

Retrofit Design Guide

Existing structures built prior to 1978 are not required to be retrofitted. However, if the building is to be converted into a housing unit with a heating unit and/or electricity, an energy audit is required.

- A building is listed on the NRHP Registry.
- A building is located in a designated historic district and would growth in historic character.
- Acquisition of NHAH.

Energy Efficiency
Energy efficiency measures can be implemented in a number of ways, including:

- Insulation of walls, floors, and ceilings.
- Weatherstripping doors and windows.
- Sealing air leaks.
- Upgrading heating and cooling systems.
- Installing energy-efficient light bulbs.

Installation of NHAH
The National Historic Preservation Act (NHPA) requires that any project involving the alteration of a historic building must first be reviewed by the National Historic Preservation Commission (NHPA).

Design Considerations
When retrofitting a historic building, it is important to consider the building's historic character and to use materials and techniques that are compatible with the original structure.

reuse of materials

Detailed Strategies and Interventions

The shoreline promenade was straightened to create a clearer, more legible waterfront edge.

The former water plaza concept was reimagined as a flexible dry performance and event space.

Tram line introduced

Courtyard as a concept gets introduced

Building masses were scaled down to improve daylight, views, and spatial comfort.

Interim Critique

A central courtyard typology emerged as the organising spatial principle for the neighbourhood.

Tram line changed to a buided gas route

Promenade made more orthogonal

A seasonal fairground and new water-sports facilities reactivated the waterfront.

Building arrangements were sculpted to create welcoming thresholds and guide movement into the site.

Diverse green areas were introduced, offering different forms of recreation and ecological value.

Shared street gets introduced for pedestrian comfort

Bridge alignments were straightened to improve connectivity and ease of use.

Final Critique

Design Changes

Our design process began by analysing the architectural character of the harbour “fingers” and the historic street layouts that once shaped the site. Using these precedents, we set a simplified organisational framework and defined key axes that became the generators for form. We carved the building massing around these lines, creating courtyards and framing important local vistas. Together, these moves establish a coherent sequence of waterfront spaces rooted in local history while producing a clear, contemporary spatial logic.
